Product: *AuxSwitchSet*

Part Numbers: 95339 , Price: USD 69.95 (base unit only, power and aux audio harness are required and sold separately)

Availability: 3/8/2005

Photo and assembly drawing available at : www.cellset.com/auxswitchset.html

Description of Model: *AuxSwitchSet* allows the user to connect two audio sources to his bike's auxiliary input. It is a dual input, ground loop isolator with auto sense switching between active input sources. This device was designed to connect to an intermittent audio source, such as a satellite radio, and a steady audio source such as an MP3 player. The user can turn on both audio sources and as long as there is audio present from the satellite radio, that audio source is presented to the bike's auxiliary audio input. If the satellite signal fades, causing loss of audio for at least 8 seconds, *AuxSwitchSet* switches the auxiliary audio input to the MP3 player.

Power and Aux audio connector harnesses are available to connect the base unit to the specific bike make and model.
